Deer resistant plants for the Rogue Valley

Despite the beauty of wildlife and the serenity that watching it brings, living in heavily deer populated areas presents a challenge with landscaping. Deer are vegetarian and therefore love to graze on those fresh shrubs and flowers you plant to beautify your yard. The following are some tips to help discourage deer from damaging your yard as well as a list of plants that have shown resistance to grazing. However, nothing is truly “deer proof”. Expect some grazing especially from fawns until they know what they like and dislike.

Deer repellents

Of the many deer repellents on the market, **Fertilome’s ‘This-1-works’** has proven to be an exceptionally effective product that won’t wash off with rain or constant irrigation when applied according to directions.

This means that it only needs to be applied as your plants put on new growth. As effective as this is, it isn’t suggested for use on edible crops (remember - it won’t wash off). The best way to protect your edible crops is to fence them off. **Fertilome’s ‘This-1-works’** is made with a nontoxic yet very bitter substance called Bitrex that not only tastes terrible but also has a very faint smell that deer can pick up keeping them from grazing other plants that are sprayed as well.

Protecting Trees

Staking and fencing is certainly the most effective way to protect young trees from the damage a buck can do with his antlers. You may have limited success using a tree wrap.

Deer resistant Plants

The following plants have been found to be resistant to grazing by deer in most areas in the Rogue Valley. When choosing deer resistant plants, the most resistant will be those with a strong scent or flavor, fuzzy or white leaves, or needle like foliage such as conifers.

The number in front of the common name denotes the level of resistance, 3 being the most resistant. Also, look for this symbol on our nursery stock signs which denotes a ‘deer resistant’ plant.
